

To Install EuroFormix on mac – version 4 -

Acknowledgements

Thanks to Vanessa Duchamp and Nathalie Hauser for providing earlier version of this guide.

Thanks to Rebecca Mitchell and Siqi Zhao for finding solutions to compiling issues.

1. Start a terminal window. Make sure that R is installed (in my case, R 3.4.1):
 1. `r --version`
2. Otherwise follow this procedure to install the latest version of R with homebrew. (<https://apple.stackexchange.com/questions/121401/how-do-i-install-r-on-os-x-using-homebrew>):
 1. `ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"`
 2. `brew tap homebrew/science`
 3. `brew install r`
3. Install the requested packages (need to choose a CRAN mirror). Start R in terminal:
 1. `r`
 2. `install.packages("BH")`
 3. Other required packages:
`install.packages(c('gWidgets2tcltk','forensim','cubature','XML','RCurl','plotly'))`
 4. `q()`
 5. `n`

This will close R without saving the session.

4. You may need to install Xcode (apple developer tools). Find out which version matches your OS and download it [here](#).
5. Install C++ compiler (if not already installed):
 1. `brew install gcc`
 2. `brew link gcc`
6. Redirect the compiler by updating the Makevars in the home directory (~):
Create/open following file: `~/R/Makevars`

Be sure that it contains the following lines:

```
CC=gcc-11  
CXX=g++-11  
CXX11=g++-11
```

7. Download folder (latest version) with euroformix from <https://github.com/oyvble/euroformix>

We follow an example with [euroformix 3.3.1](#) here.

8. Unzip the file `euroformix_3.3.1.tar.gz`. Take note of that the unzipped_folder is named (`euroformix_3.3.1`)
9. Under the terminal, move to the folder where stands the package to build (`euroformix_3.3.1` / for me on my desktop):
 1. `cd ~/Desktop/`
10. Create the package (gives a file with `tar.gz` extension):
 1. R CMD build `euroformix_3.3.1`
11. Install the package:
 1. R CMD INSTALL `-build euroformix_3.3.1.tar.gz`
12. Open R and start euroformix:
 1. `library("euroformix")`
 2. `efm()`
